Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.

Instructiions (2)

Turn the round star map so that the date matches the time you are observing.

The time shown is standard (winter) time. For daylight savings time (summer), subtract one hour, so at 9PM turn the star map to 8PM.

The Star Finder is designed for latitude 45°. If you live much further north, the patterns in the sky are similar, but fewer southern stars are visible.
