1.0 SCOPE

This document provides the information necessary to assess the suitability of a site for a Preserve Designation. It describes the application procedure and states the contents of the Application.

The RASC recognizes the value of volunteers in establishing a Preserve. These Application Requirements will minimize administrative work for Park managers, local astronomy groups and the RASC.

The Royal Astronomical Society of Canada (RASC) is a national astronomy organization established in 1868 devoted to the promotion of astronomy and allied sciences. In this capacity, the RASC encourages the protection of the quality of the night sky by minimizing light pollution.

The goal of the RASC Dark-Sky Program is to promote the reduction in light pollution, to demonstrate low-impact lighting practices, to improve the nocturnal environment for plants & wildlife, to protect and expand dark observing sites for astronomy and to provide accessible locations for naturalists and the general public to experience the naturally dark night sky.

Currently, both urban and rural sites are contaminated to different levels by sky glow from artificial lighting. We thus distinguish levels of dark sky sites as follows, though the distinction is not always clear between the categories:

Dark-sky Preserve: Sites with very dark skies with minimal sky glow are generally far from urban centres and are therefore less accessible to astronomers and the public, though these usually do contain public campgrounds.

Nocturnal Preserve: Some dark sites are remote with few resources for active outreach programs, and are designated more for the protection of the night for flora and fauna than for public amenities.

Urban Star Park: These are sites within, or close to, urban areas that are not consider "dark", but provide good access to the public.

All three designations are herein referred to as Preserves.

By promoting the use of these protected areas after dark, Preserves should see increased support from the public and usage during non-peak hours.

2.0 BACKGROUND

There is a growing need to identify and protect accessible areas that permit the public, naturalists, novice stargazers and astronomers to enjoy the night sky. There is also a growing need to identify these areas and protect them from light pollution.

The goal of this RASC Dark-sky Preserve Program is to maintain or increase the quality and accessibility of dark observing sites and preserve the ecology.

Preserves shall be accessible to the public and all lighting fixtures within its borders are to comply with the RASC Guidelines for Outdoor Lighting (https://rasc.ca/dark-sky-site-guidelines/RASC-CGOL_2020.PDF). In some cases, where desired by the Applicant for special considerations and strict preservation, public access may be limited or denied within some portion of the Preserve.

Humans and wildlife are affected by light pollution. Many living creatures have evolved to require a day-night contrast to synchronize their biological rhythms. These organisms have adapted to variations in night illumination from a dark sky to the brightness of a full Moon. In contrast, illumination levels in typical urban areas far exceed the brightness of the Moon. Unfortunately public parks are usually illuminated based on "best practice" for urban areas.

The environmental impact of artificial lighting has been studied for many years. This research concludes that light can pollute the environment and fundamentally change the ecosystem and impact the health and survival of wildlife.

2.3 Definitions

- Application the document submitted by the Management of the proposed Preserve
- Applicant the Management authority of the Preserve
- Buffer Zone the region within the Preserve under control of the Preserve Manager. The Buffer is designed to prevent glare and light trespass from shining into the Core area. There may be more than one buffer zone in the Preserve but the total buffer area shall be a small proportion of the total are of the Preserve (typically <5%).
- Core the region under control of the Preserve Manager surrounded by the Buffer Zone. There may be more than one core in the Preserve.
- Dark Time a period after which scheduled outdoor activity has ended and visitors are expected to minimize the use of light to permit other visitors to sleep.
- Dark-Sky Preserve (DSP) the region that includes the DSP Buffer Zone and DSP Core that is under a single management with authority over policy, outdoor lighting and land use.
- Filter material that removes the spectral components <500 nm from light to produce amber illumination
- Glare Zone sector between the horizon (90° from nadir) and 10° below the horizon.
- Illumination the amount of light that shines onto a surface area of 1square meter (lumens/m², or Lux)
- LPA light pollution abatement
- Luminaire the assembly of the enclosure, lamp, optics, power supply and controls
- Luminance the amount of emitted light from a light source (cd/m²)
- Nadir the point on the ground directly beneath a luminaire
- Nocturnal Preserve (NP) the region that includes the NP Buffer Zone and NP Core that is under a single management with authority over policy, outdoor lighting and land use.
- Observing Site an area promoted as a good place to observe the sky. There may be several observing sites.
- Photobiology the study of the effects of light on biological systems
- Photopic Vision vision based on cone cells that have evolved for daytime vision and high illumination levels. Their peak sensitivity is at 555 nm.
- Preserve an area under single management that is to be designated by the RASC as a Dark-Sky PreserveTM, Nocturnal PreserveTM or Urban Star ParkTM
- Scotobiology the study of the biological need for periods of darkness
- Scotopic Vision vision based on rod cells that have evolved for night vision and low illumination levels. Their peak sensitivity is at 505 nm.

- Sky Quality Meter (SQM) a light meter designed specifically to measure a value for the brightness of the night sky. These meters are available from Unihedron, Inc., or via a short-term loan from the RASC.
- Urban Star Park (USP) the region that includes the USP Buffer Zone and NP Core that is under a single management with authority over policy, outdoor lighting and land use.

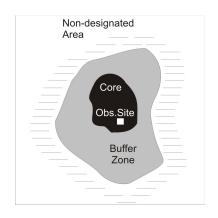

Zenith - a point directly overhead, or 90° up from the horizon.

3.0 MANAGEMENT REQUIREMENTS

The Preserve shall be under the management of a single entity to ensure full adherence to these Requirements and the RASC-CGOL.

A Preserve is a protected area with a Core and a Buffer Zone. The Buffer Zone prevents light from outside the Preserve from reaching the Core area. The Manager of the Preserve shall identify specific observing sites that will be accessible for night observing.

The establishment of a Preserve is a partnership between the Management, local stargazers and astronomers, and neighbouring municipalities, and it requires their active support. There are four principal requirements for a Preserve: compliance to the RASC-CGOL, accessibility, quality of the

night sky and in the case of a DSP and USP, an active outreach program. NPs may not have the resources to provide an outreach program, but may do so if such resources can be provided by the park management.

3.1 Outdoor Lighting

The RASC-CGOL respects and protects the need for naturally dark nights, yet it allows sufficient lighting for safety and navigation within the Preserve.

These CGOL defines the spectrum (colour), brightness (illumination), shielding (extent of light) and the schedule (timing) for all artificial light that is used. These CGOL is free to be downloaded from the RASC website (https://rasc.ca/dark-sky-site-guidelines/RASC-CGOL_2020.PDF).

The Applicant shall ensure that all lighting in the Preserve complies with the RASC-CGOL. Compliant and non-compliant lighting shall be reported in the appropriate section of the Application. The Applicant shall also provide a schedule for all non-compliant luminaires to reach compliance.

If the Applicant believes specific luminaires cannot be compliant, an explanation shall be included in the Application. The RASC may choose to waive or amend any of these guidelines for a specific application provided that the integrity of the Preserve programme is not jeopardized.

3.2 Accessibility

The Applicant must ensure the core area remains accessible after the end of twilight. This will require that gates and parking lots remain open for visitors. If some areas are to be restricted from the public for reasons of ecologically sensitivity, they should be identified in the Application.

There shall be appropriate signage to help visitors navigate the Core of the Preserve. This signage shall conform to the RASC-CGOL.

3.3 Quality of a Night Environment and Dark Sky

The illumination by artificial lighting in a Core and Buffer Zone shall comply with the RASC-CGOL (https://rasc.ca/dark-sky-site-guidelines/RASC-CGOL_2020.PDF).

All artificial lighting within the Core shall not affect the ecological integrity of the Preserve or the natural quality of the night sky in terms of diffuse sky glow, luminance (glare) and illumination (surface brightness). All luminaires shall be shielded to limit the extent of the luminance and illumination to only areas where needed for permitted human activity.

Photographic images of the horizon from the observing sites, and descriptions by experienced observers, shall be used to document the sky glow on the horizon and the impact of light fixtures. These data shall be recorded annually to assess and monitor the darkness of the sky above the Preserve (zenith) and shall be submitted to the RASC-LPA Committee every year approximately on the anniversary of the DSP Designation.

3.4 Outreach Programs

For, Management of Dark-Sky Preserves and Urban Star Parks shall develop and manage more than two outreach programs per year designed for public and municipal outreach.

Public outreach is for visitors to the Preserve and will consist of raising awareness of the connection of dark skies to night ecology and raising awareness of stargazing or other night-time activities. Knowledgeable staff or members of local astronomy clubs or other organizations may assist with these activities. Topics may include, but should not be limited to mythology, star tours, telescope observation, indoor presentations, walking tours after dark, experiencing sounds of the night and night wildlife and the explanation of how artificial lighting affects the ecology.

If volunteers are used by Management to assist in public outreach activities, a Memorandum of Understanding may be signed by all parties stating the terms of the voluntary service. See Appendix B for a suggested draft of a MOU. This may also may be regulated through normal programming contracts used by the park.

Management shall encourage the reduction the light pollution that is visible from the Preserve. Municipal outreach is to protect the Preserve from light pollution from neighbouring areas and municipalities by raising awareness of the Designation. This is an investment to protect the ecological integrity of the Preserve. In the course of this outreach, possible or planned development adjacent to the park that may degrade the quality of the night environment should be identified, and the Park shall promote properly designed and installed lighting that will minimize these impacts. Failure to reach some sort of mutual understanding of the effects of nearby development may effect certification or classification of the park and may require revision of the Buffer Zone boundaries and may cause the revoking of the Preserve designation.

3.5 Nomination Process

The Manager of the proposed Preserve may submit the Application for consideration to the RASC consisting of the documentation listed in Table 4.0 and defined within Chapter 4,

and other materials that may be requested by the RASC to help them judge the suitability of the proposed Preserve.

The RASC will acknowledge the receipt of the Application when it is received and will review it in a timely manner. Comments and questions will be transmitted to the Manager of the proposed Preserve. The decision of the RASC will be communicated to the Manager. The RASC will attempt to expedite their decision by a specific date if requested by the Applicant (i.e. for an official announcement).

Upon the award of the Designation, the Preserve should display a sign identifying it as a RASC DSP, USP or NP. The RASC will be provide a logo graphic for use of the Preserve on their signage and communiqué, should the Applicant desire to use it.

3.6 Naming of the Preserve

The name of the Preserve shall be determined by the RASC in consultation with the Applicant. Generally, the Preserve will be named after the geographical region. In the case of existing Parks, the Preserve will be given the name of the park.

3.7 Annual Reporting

An Annual Report is required from the Manager of the Preserve to help the RASC monitor and promote the Preserve and it will help maintain communications between the RASC and the Park. It should document outstanding deficiencies from the Application or previous Report. The RASC will attempt to work with the Preserve Management to resolve these issues.

3.6 Revision to Designation

It may become necessary to review the Preserve designation due to changes in Park priorities, signatories of the MOU, or changes in the lighting within or beyond the Preserve boundaries.

If the Preserve is deemed to be no longer viable by the sponsors of the Park or the RASC, the Designation will be rescinded and a letter will notify the Manager. The Park will be required to remove signage referring to the Preserve Designation and the Park shall no longer promote itself as a Preserve.

4.0 APPLICATION REQUIREMENTS

This chapter presents the required content in the Preserve Application.

The designation as a Preserve is based on its current merits and the Application should reflect the current state of the site, not the future plan for the site. As such, the proposed Preserve should be compliant to the RASC-CGOL. The Preserve may be expanded, or reduced, as more area becomes compliant to the CGOL.

There are ten sections to the Application (see Table below). This information will help the RASC assess the status of the current property and will be used in promoting the Preserve to other organizations and the public. This information locates, defines, describes and documents the Preserve, including the sky quality and the state of the outdoor lighting This information will also be used as a baseline to compare future state of the Preserve.

Preserve Nomination Documentation List

- 4.1) Statement of compliance to the RASC-CGOL
- 4.2) Location and description of the proposed Preserve
- 4.3) Zenith sky quality measurements (location of the reading marked on map)
- 4.4) Public outreach plan (education)
- 4.5) Municipal outreach plan
- 4.6) Existing light fixture inventory
- 4.7) Lighting plan
- 4.8) Images of the Preserve's observing sites taken during the for day and night
- 4.9) Memorandum of Understanding between all partners
- 4.10) Letters of support and commitment from neighbouring municipalities

4.1 Statement of Compliance to RASC-CGOL

This section assesses the Applicant's understanding of the RASC-CGOL and its readiness to become a Preserve. The CGOL was developed to minimize the contamination of the area by artificial lighting and addresses both the needs of wildlife and astronomers.

The Applicant must state whether the proposed Preserve is currently compliant to the CGOL. They should be specific about any non-compliances in their outdoor luminaire inventory. The basis for the acceptance will vary depending on the total application. The RASC may choose to waive or amend any sections of the CGOL for a specific application to ensure the integrity of the Preserve programme is not jeopardized.

4.2 Scale Map of Preserve and Surroundings

Where is the proposed Preserve? The RASC requires sufficiently detailed scaled and labelled maps and directions in order to promote the Preserve. These maps must show the regional context of the Preserve and the boundaries between the Buffer Zone and the Core. Applicants should plot the location of observing sites, including access roads, campgrounds (if any), and all other facilities that are mentioned in the Application. Additional larger scaled maps of areas within the Preserve may be used to provide more detail.

4.3 Zenith Sky Quality Measurements

The sky quality of the observing site(s) must be rated. The RASC or local experienced observers approved by the RASC, should report sky quality measurements, obtained with the Unihedron Sky Quality Meter, or equivalent. The locations where these readings were taken should be marked on a map of the Preserve. These readings should be listed in a table with cross-references to their location. Brightness readings shall be taken on clear nights after astronomical twilight ends, and with no Moon in the sky. The table will include dates and times when these readings were made since they will vary by time of night and season. These reading will also be used to benchmark sky glow in the area. Subsequent annual readings will document improvements over time.

4.4 Public Outreach

The RASC Preserve Program is designed to improve or restore a park to more natural darkness through appropriate use of outdoor light. This will improve the health and welfare of flora and fauna and will provide an improved visitor experience at night. This is achieved through changes in lighting practices and through educational programming. Visitors to the Preserve may not be aware of these topics and will benefit from the experience.

The DSP shall be open after dark so visitors can experience the night with stargazing, astronomy and night talks and night walks.

Literature should be made available to the public during these sessions and in kiosks (if available). Astronomy and light pollution information may be obtained from the RASC on a cost recovery basis.

There is a list of night programs the DSP may offer the public. It includes, but is not limited to the promotion of a healthy nocturnal environment and the relationship between the skylore of the First Nations and other cultures. Reference may be made to the new science of scotobiology and how it is changing our awareness of our need for periods of darkness. Management is encouraged to contact other DSPs for more ideas. Every Preserve is different, so some programs may be more appropriate than others.

4.5 Municipal Outreach

Urban growth outside Park boundaries can severely contaminate the night sky over the Preserve with artificial sky glow. An active Municipal Outreach Program should be attempted to protect the Preserve from increases in urban sky glow, and to improve the quality of the night sky into the future.

Managers, with the support and assistance of local astronomy groups environmentalists and scotobiologists, should give presentations to neighbouring municipalities to promote the use of CGOL-compliant fixtures with full cut-off shielding and low colour temperature lamps to protect and improve the quality of the night sky over the Preserve. These presentations will, as a minimum, inform surrounding municipalities of the pending Preserve and will register the request for the municipality to participate in active preservation efforts that will help retain the park as a Preserve. Advice and digital files of presentation materials may be obtained from the RASC.

Repeated reminders of the adverse impact of outdoor lighting on the environment and human health are more effective than a single-mention of it in the media. Therefore, Managers and local partners should regularly raise the issue of light pollution in the local and regional media and in the business community.

4.6 Existing Luminaire Inventory

This is perhaps the most time consuming part of the Application, but it is also one of the most important.

Light fixtures are regularly installed but rarely removed. They have been installed prior to any understanding of the impact they have on the night ecology. The site may have accumulated dozens or hundreds of outdoor lights - many of which are no longer necessary.

This inventory should be presented in tabular form (MS-Excel for example) that includes the location, quantity, wattage, shielding and lamp type (colour, HPS, LED, etc.) for all outdoor luminaires in the Buffer and Core areas of the Preserve. The luminaires should be plotted and referenced on supporting maps. This inventory must be updated and submitted to the RASC every one- to two-years.

4.7 Lighting Plan

This section presents the plan and schedule to make all luminaires compliant to the CGOL. It should schedule the removal, replacement and modification of all non-conforming lighting fixtures. This work should be scheduled and budgeted before the anniversary of the Preserve's designation. Explanations for the submitted schedule and any delayed compliance should be included in this section.

4.8 Images of Proposed Preserve

These images will be posted on the RASC Preserve Website to help promote the Preserve to potential visitors and will give them an indication of what to expect. There should be daytime and nightime panoramas of the Observing Sites (stitched together from a series of images) showing the cardinal directions, tree line, bushes, buildings, etc. They should be presented with the same scale so they can be compared.

The night panorama will also document the existence of sky glow around the horizon. They will be used as a benchmark against which future images can be compared to show improvement or degradation of the site.

4.9 Memorandum of Understanding

The Applicant should obtain MoUs from all independent businesses or leasees operating within the Park who may have outdooring lighting. They should understand that they will also have to comply with the CGOL and perhaps other requirements of the Preserve.

An understanding from other park departments who supply buildings or lighting to the Park must also be informed that their lighting must also comply with the requirement of the Preserve. Furthermore, all electrical contractors or companies tendering work within the Preserve must be given a copy of the RASC-CGOL and required to comply.

Preserves with designations that pre-date the CGOL (2008) must upgrade their lights to the CGOL when replacing pre-2008 luminaires.

The Preserve should actively promote these outreach activities. If the Preserve staff are not familiar with stargazing or the nocturnal wildlife, the Management should reach out to local astronomy and wildlife groups to help in this endeavour. Letters of interest from partners should be included in the Application. A Memorandum of Understanding (MOU) between the Management of the Preserve and the volunteers may be used to clarify expectations and avoid disagreements (APPENDIX B).

4.10 Letters of Support and Commitment

Future protection of the Preserve depends on the policies of neighbours. The Applicant should attempt to solicit letters of support and commitment to reducing the light pollution from neighbouring municipalities. They should agree to implement policies or bylaws to help protect the Preserve in the future with, as a minimum, full cut-off shielded lighting and <3000K CCT luminaires. Use of amber light and automatic will also be helpful.

5.0 ANNUAL REPORTING

The Manager of the Preserve shall submit this Report so that the RASC may monitor the site and outreach activities. It should be submitted to the RASC National Office on or about each anniversary of the designation.

The contents of the Report shall include the following.

1) Name, title and contact information of the following personnel if applicable.

Preserve Manager (Superintendent or Commercial Park owner),
Facilities Manager and User experience Coordinator.

Rationale: The management personnel may change as they continue along their career paths. The RASC requires the current contact person responsible for the Preserve for communication on matters concerning the Preserve.

2) The revised audit of outdoor luminaires in the Preserve.

Rationale: The original Application contained a table of all outdoor lighting in the Preserve. These luminaires, and any others that were added after the designation should be monitored. This table can be an edited version of the spreadsheet file that was submitted in the original application. Generally after two years from the Designation, all initially non-compliant luminaires should have been modified, removed or replace with compliant luminaires. Luminaires that remain non-compliant should be highlighted with the reason for continued non-compliance with the plan to bring them into compliance.

3) Sky Quality Readings. The quality of the sky is measured with a Sky Quality Meter (SQM, Unihedron, Inc.).

The SQM measures the brightness of the sky at the zenith. If left uncontrolled this sky glow generally increases with brighter and more extensive light pollution within a Park and from neighbouring municipalities. Long-term measurements will show the success of the Preserve in protecting the night environment.

To allow direct comparisons over time, readings should be made at the same locations that were measured in the original Application.

4) List and describe of Public Outreach Activities for night ecology and astronomy.

This should include the nature of the outreach event(s) and an estimate of the number of visitors taking part in the event(s), and the dates. It should also name the volunteer groups that contributed in the outreach programs. If the event is regularly scheduled, then they may be collapsed into a single entry and identified as recurring. The RASC will use this information to help guide the development of outreach resources that could be made available to Preserves to assist in the user experience.

5) List and describe Municipal Outreach Activities that concern light pollution.

The Preserve Manager is required to meet with neighbours to ensure the protection of the night environment in the park. The report on these meetings should highlight the discussions on outdoor lighting that may shine into the Park (glare or light trespass) or over the park as sky glow. (If sky glow over the urban area is visible from the Preserve, then it is affecting both the ecology of the Preserve and the user experience of the wilderness area.)

Municipalities play a significant role in maintaining the ecological integrity of a Preserve. However this information about the Preserve, and its needs, may not be passed on during the turn over in municipal staff. Neighbouring municipalities may economically benefit from the Preserve, so it is in the best interests of both parties to have semi-regular communications and meetings.

6) Annual Reports

Include, or provide a link to the Park's preceding Annual Reports that was prepared for their provincial or federal agencies. These have more extensive information that will put their current and future policies and activities into perspective. Commercial parks should also provide a copy of their corporate annual report, if applicable.

MEMORANDUM OF UNDERSTANDING

MANAGING AUTHORITY OF DSP (FACILITY PROVIDER)

-and-

ASTRONOMY SERVICE PROVIDER (OUTREACH CONTRIBUTOR)

This agreement is made this day of, 2017
WHEREAS, The FACILITY PROVIDER has applied to become designated as a Dark-Sky
Preserve (DSP) by the Royal Astronomical Society of Canada, and
AND WHEREAS, a Memorandum of Understanding (MOU) between the FACILITY
PROVIDER and the OUTREACH CONTRIBUTOR will outline the roles and
responsibilities of the parties in order to become and maintain the DSP designation,
NOW, THEREFORE, BE IT RESOLVED THAT the FACILITY PROVIDER and the
OUTREACH CONTRIBUTOR, collectively referred to as the "parties", agree as follows:

1. Purpose.

The purpose of this MOU is to articulate the role and responsibilities between the parties in the accomplishment of adhering to the protocols of the RASC's DSP Program as laid out in the Guidelines for Outdoor Light in DSPs (RASC-DSP-CGOL) in order to maintain the OUTREACH CONTRIBUTOR's designation of the FACILITY PROVIDER as a DSP.

2. Statement of Mutual Benefit and Interests.

The parties recognize the importance of an exceptional dedication to the preservation of the night sky through the implementation and enforcement of quality lighting codes, dark-sky education, and citizen support for dark skies, and that achieving designation as a DSP provides many benefits to wildlife and the community including preservation of the night sky and reductions in night time light pollution.

3. Duties of the Parties.

The parties agree to work together to maintain the DSP designation and to uphold the tenets of dark-sky policies as described by the RASC's DSP Program as laid out in the Guidelines for Outdoor Light in DSPs (RASC-DSP-CGOL).

4. General Provisions.

The parties agree to the following:

- The parties will consult on all installations of new outdoor lighting fixtures, retrofit and replacement or relocation of all existing outdoor lighting fixtures or increases in light intensity of any existing outdoor lighting fixtures on FACILITY PROVIDER properties;
- The parties will consult with the RASC Light Pollution Abatement Committee
 when determining proper adaptive controls and curfews on outdoor lighting fixtures
 where appropriate.
- The parties will work together to support dark skies and good lighting in public communications promoting the concepts of dark skies and good lighting.

- The parties shall work together to maintain a commitment to providing dark-sky education programs by:
- Planning and execution of at least two community dark sky awareness events per year;
 - Inclusion of dark-sky awareness documents with other community informational documents ` that are made available to FACILITY PROVIDER volunteers and visitors:
 - Developing and presenting dark-sky events with activities tailored for school groups visiting the FACILITY PROVIDER and within its outreach programs.
- The parties shall work together to investigate and the possibility of establishing and maintaining a sky-brightness measurement program which might include the installation of light monitoring devices.
- The parties shall work together to prepare an annual report with basic information on the effects of the DSP designation on wildlife on the FACILITY PROVIDER.

5. MOU Effective Date and Termination.

This MOU between the parties takes effect upon the signature of both parties. The parties agree that January 1 shall be considered the "Anniversary Date" of this MOU. The MOU should be renewed annually on the Anniversary Date unless either party provides notice of termination to the other by September 30 of the prior year.

APPENDIX B - Sample Table Current Luminaire Inventory

LOCATION	WATTAGE	No. UNITS	SHIELDING	LAMP	Comments
Administration					
Front door	125	3	Unshielded	HPS	To be replaced with FCO 2W Amber LED, 05/2013
Perimeter Lighting	3	5	FCO	amber LED	wallpacks (EcoLight) - Compliant
	35	2		LPS	not working
Maintenance Compound	100		Unshielded.	HPS	Replace with FCO in next maintenance cycle, 04/2014
Garage		1	Not shielded	Incandescent	To be replaced in next maintenance cycle, 04/2014
Campground	100	2	Not shielded	HPS	Replaced before this camping season, 05/2013
Showers	5	2	FCO	White LED	To be filtered this camping season, 05/2013
Toilet	2		FCO	Amber LED	Compliant
#1 Parking Lot	125	1		HPS	Currently burned out and will be replaced with FCO Amber LED
Access Roads	50			HPS	Use for special event only - safety
Gate Kiosk	35	1	FCO	HPS	Compliant

NOTES:

All shall be made to comply before the current camping season unless otherwise stated.

Current maintenance cycle - April 2013-November 2013 Next maintenance cycle - April 2014-November 2014

APPENDIX C - Scotobiology

STUDY OF THE BIOLOGICAL NEED FOR PERIODS OF DARKNESS

An outline for public information prepared by Dr. R.G.S. Bidwell, Wallace, NS, 2008

What is Scotobiology?

The concept of scotobiology as a science was developed at a conference on light pollution held in Muskoka, Ontario, in 2003. It was recognised that the underlying principle was the deleterious effect of light pollution on the operation of biological systems, ranging from their biochemistry and physiology to their social behaviour. Scotobiology is the study of biological systems that require nightly darkness for their effective performance; systems that are inhibited or prevented from operating by light.

Why is Scotobiology important?

Virtually all biological systems evolved in an environment of alternating light and darkness. Furthermore, the light/dark periods in temperate zones vary with the seasons. Organisms have evolved to use the variations in the length of day and night to integrate their physiological and social behaviour with the seasons. Many organisms measure specifically the length of the night, and light pollution may prevent them from determining the season, with serious or deadly consequences. For this reason light pollution is recognised as being a major component of global pollution, and scotobiology, the study of its specific effects on organisms, has now become an important branch of biological research.

Summary of specific scotobiological responses

<u>Insects:</u> Insects tend to fly towards light. Light pollution thus causes insects to concentrate around bright lights at night with several serious consequences. First, they become easy prey for birds and predacious insects. Insect numbers are reduced by their disorientation and death around lights, and also because they are concentrated where natural predators have an unnatural advantage to capture them. This reduction in insect populations has been found to affect the populations of animals not strongly attracted to light, including frogs, salamanders, bats, some birds and small mammals. In addition, the mating and breeding habits of some insects require darkness, so that light pollution can interfere or prohibit normal reproduction. Finally, the migration habits and paths of many insects are affected by light pollution with resulting population depletion. The huge piles of dead insects such as mayflies that are found under streetlights in springtime give some idea of the extent of damage such lights can cause.

<u>Birds</u>: Many birds are powerfully attracted to lights, and over a hundred million birds die from collisions with illuminated structures in North America alone every year. The actual loss of bird populations is hard to calculate, but it is significantly large. Furthermore, as with insects, bird migration patterns may be affected by light pollution because the birds may become disoriented and unable to follow their normal flight paths. Finally, the concentration of birds around lights also encourages animals and birds of prey that feed on smaller birds, resulting in still further reductions in the population numbers of migrating birds.

Animals: The behaviour of many animals is seriously affected by light pollution. Mating, hunting and feeding habits of wolves and other large animals are altered, with resulting decreases in population. Salamanders, frogs and other amphibians, many of which are already under serious threat from chemical pollution, are subject to impacts from even low levels of artificial night lighting on their physiology, ecology, behaviour and evolution. It is very likely that the behaviour of many if not most of our wild animals is similarly and negatively affected by even low levels of light pollution.

<u>Plants:</u> Plants are seriously affected by light pollution. Probably the most important aspects of a plant's reaction to and interpretation of darkness are expressed in its developmental behaviour: flowering, dormancy and the onset of senescence. The plant's ability to measure and respond to day length is crucial in enabling it to dovetail its developmental behaviour with the seasons. We are all aware of "long-day" and "short-day" plants. What is not so widely known is that plants do not measure or react to the length of the day. Instead, they measure and respond to night length, i.e. the duration of darkness. So short-day plants really require long nights, and should properly be called long-night plants. The problem for short-day/long-night plants arises from the fact that if they are illuminated briefly during a long night, they interpret the event as if they had experienced two short nights, rather than one long night with an interruption. As a result, their flowering and developmental patterns may be completely interrupted. Short-day plants normally bloom in the fall, as the days shorten, and they respond to the lengthening nights to initiate the onset of flowering. As the nights further lengthen, they begin a period of dormancy, which enables them to withstand the rigours of winter. Thus, if the nights are interrupted by light pollution, the consequences can be severe or deadly. Furthermore, the effect of successive experiences of nightly illumination is cumulative. It follows that light pollution, particularly if it is repetitive on a nightly basis, can seriously affect the development, flowering and dormancy – and so the very existence – of short-day (longnight) plants.

Human Health: Humans, like other animals, are affected by nightly light pollution, and human health is more severely affected by light pollution than is generally realised. Human hormone regulation, physiology and behaviour evolved in a diurnal pattern of day and night. The normal operation of wake/sleep cycles, hormone cycles, the immune system and other biochemical behaviour, depends on the daily alternation of light and dark, and may be severely damaged by nighttime illumination. It has been shown that the human immune system works more strongly during the day to produce antibodies that protect the body against microbial invasion, which is normally more likely to occur during the activities of the day. At night the immune system switches from a defensive to a repair mode, and killer cells then become more active in attacking tumours as well as infections that may not have been successfully prevented during the day. Light pollution may thus compromise the operation of human hormone and immune systems leading to increased incidence of cancer and other diseases, as well as to other physical as well as psychological disorders including mental illness, psychiatric instability, and such problems as seasonal depression (SAD). This means that even turning on a night-light or bedside lamp may have negative effects on a person's health. This may have little relevance to light pollution in parks, but it is important to note that bright lights in camp-sites may be unhealthy to humans as well as to the wildlife inhabitants of the park.

<u>Sociology:</u> Human sociology is affected by light pollution. It is now commonplace to be concerned by the fact that few people alive today have had the opportunity to experience the glory of the night sky. This is sad for citizens of "advanced" or wealthy countries, but it is a serious loss of the cultural heritage of aboriginal peoples and those who live (or lived) under natural and unpolluted conditions. The darkness of the night and the ability to commune with the natural beauty of the moon and stars and the glories of the aurora are necessary for the well-being and sociological wholeness of native peoples all over the world. Most of those who live in places like Canada and the United States of America can no longer experience the wholeness of dark skies. Parks that emphasise dark skies are thus an essential part of our human and environmental heritage.

<u>Astronomy:</u> It hardly needs to be mentioned that astronomy depends on dark skies and the virtual absence of light pollution. Both the importance and cost of astronomical research to our present society are very high, and are as important as environmental concerns for the control of light pollution.

Prospects for abatement of light pollution: the importance of public opinion

Public pressure is the surest way to reduce light pollution. This will assist releasing more funds for basic research in scotobiology, and for helping to develop legislation to control light pollution if that is found to be necessary. Light pollution can be controlled by reducing unnecessary lighting, focussing required lighting where needed rather than shining it in every direction, and the use of directional light shades where appropriate. Lower levels of illumination are often advantageous, and have been found to provide better safety and protection for pedestrians than the normally used bright streetlights. All these approaches are already being developed and put to use, but the continued application of public pressure is essential to reduce not only the actual light pollution and the cost in dollars for unnecessary lights, but also to reduce the environmental pollution that results from making the electricity to power them. Anything that can be done to stimulate public appreciation of the dangers and costs of light pollution will be well worth the effort.
